1. Overview

Data Highlights

64,065	Transactions Analysed
3	Store Locations
6 months	Jan – Jun Data Period
9	Product Categories
80	Individual Products Tracked
698,812	Total Revenue Represented

Description

This analysis covers six months of point-of-sale transaction across the Coffee Shop's three New York locations – Hell's Kitchen, Astoria, and Lower Manhattan

2. Key Insights (i)

01

Coffee and Tea together drive two-thirds of all revenue. Coffee alone generates \$269,952 (38.6%), followed by Tea at \$196,406 (28.1%) a combined 66.7% of total revenue from just two of nine categories.

02

The remaining seven categories, including Coffee Beans (\$40,085) sold for at-home brewing, together contribute less than 35% of revenue, with the lowest four categories combined generating under 5%.

03

These lower-performing categories are strong candidates for bundling or promotional campaigns to lift their visibility.

Revenue Share by Time of Day

2. Key Insight (ii)

01

Morning drives more than half of all revenue. It generates 55.6% of total revenue (\$388,289), more than Afternoon, Evening, and Night combined.

02

Afternoon is a distant second at 29.3% (\$204,721), followed by Evening at 14.7% (\$102,867).

03

Night trades at just 0.4% of revenue (\$2,936) across all three stores , a clear signal that demand, staffing, and marketing spend should be weighted heavily toward the first half of the day.

Revenue by Store Location and Time of Day

2. Key Insights (iii)

- 01

Morning dominance isn't uniform across locations. Lower Manhattan is the most morning-dependent store, with 62.6% of its revenue coming from Morning alone, followed by Hell's Kitchen at 59.0%.
- 02

Astoria is meaningfully more balanced, at only 45.2% Morning its Afternoon trade (\$78,567) is nearly as strong as its Morning trade (\$104,943) Astoria has zero recorded Night sales, while Hell's Kitchen (\$2,636) and Lower Manhattan (\$299) both worth noting this could mean Astoria closes earlier, or simply sees no late demand at that location.
- 03

A single blanket "Morning promotion" strategy won't fit all three stores equally Astoria's more even distribution suggests it may benefit more from an Afternoon-focused push than a Morning one, while Lower Manhattan and Hell's Kitchen are the ones most reliant on the morning rush

2. Key Insights (iv)

01

Revenue nearly doubled over the period up 103.8%, from \$81,678 in January to \$166,486 in June. Growth wasn't steady throughout: the steepest single jump came between April and May (+31.8%), a shift worth investigating further whether it reflects seasonality, a marketing push, or a product launch isn't visible in this dataset alone, but it's a strong candidate for follow-up.

02

All three store locations perform within 3% of each other. Hell's Kitchen leads at \$236,511, narrowly ahead of Astoria (\$232,244) and Lower Manhattan (\$230,057). This consistency suggests location isn't a meaningful driver of performance here strategies proven at one store (e.g. a Morning promotion) can likely be rolled out across all three with similar expected results.

3. Recommendations (i)

01 Run targeted promotions during Evening and Night, Evening and Night combined generate only 15.1% of revenue, with Night at just 0.4% (\$2,936). A discount window, loyalty double-points period, or limited-time menu during these slots

02 Protect and prioritize our top performers, Coffee and Tea drive 66.7% of total revenue. Ensure inventory, staffing, and shelf space are optimized around Morning when 55.6% of all revenue is earned so doesn't risk stockouts or slow service during its most valuable window.

3. Recommendations (ii)

03

The bottom four categories (Branded, Loose Tea, Flavours, Packaged Chocolate) contribute under 5% of revenue combined. Bundling these with best-sellers (e.g., a Latte + Packaged Chocolate combo) or featuring them in seasonal promotions could lift their visibility without requiring new inventory investment.

04

Revenue jumped 31.8% between April and May, the sharpest single-month increase in the dataset. It could reflect a promotion, seasonality, or a new product launch. Identifying the driver is worth investigating, since the same tactic could potentially be applied to Jan-Mar, currently the slowest months of the period to lift their performance rather than leaving the growth to occur on its own.
